

IKONOSKOP™

Wave to the camera.

Ikonoskop, the first Swedish camera manufacturer since Hasselblad, introduces it's new digital motion picture camera: A-cam dII. A-cam dII offers professional image quality with high-resolution images, ready to use out of the box.

Uncompressed. Be impressed.

The ability to capture uncompressed images (stored as individual raw format .dng files) gives A-cam dII an immediate advantage: unprecedented image quality. Finally a digital motion picture camera that allows you to shoot 12-bit images without any compression whatsoever. Wave goodbye to expensive hours in the post-production studio. Wave hello to A-cam dII. Don't compromise, don't compress. Use a camera that loves you instead.

The fastest memory card. Ever.

The 80 GB Ikonoskop Memory Cartridge records at 240MB/s – almost twice the speed of the second-fastest memory card on the market. So what does that mean? In a sentence: sharper, crisper, more dynamic images. The more memory you can store per second, the higher the resolution becomes. This means you get more frames (up to 60 frames/second) out of the camera, still at an uncompressed, 1920x1080 pixel, quality. We're talking follow-a-bullet-through-the-air quality. We're talking a new year, a new resolution.

Easy to hide. Not that you'd want to.

The compact and appealing design of A-cam dII makes it an ideal choice for all those situations where size matters. Sleek enough to fit into your glove compartment, A-cam dII weighs around 1000 gram and is arguably the smallest professional motion picture camera on the market. On the sofa table, it might get jealous looks from your Blackberry, your iPhone, and your Wii control. And with about as few buttons as your favourite jacket, it's super-easy to operate.

Brought to you by Ikonoskop, the innovators behind A-cam SP-16 – the smallest, lightest and most affordable Super 16 camera in the world ever. Founded in 2003 by experienced Swedish filmmakers Göran Olsson and Daniel Jonsäter, Ikonoskop focuses on creating affordable, cutting-edge equipment for established and independent filmmakers in all fields. Ikonoskop is one of only two companies in the world that produces, understands, and benefits from working with both analogue and digital motion picture technology.
